What is the Watershed Water Cycle

Ninety percent of the water on Earth is in the oceans, but this doesn’t mean that water is not part of our daily lives. Water is essential for all forms of life, from the smallest organisms to the largest mammals. It is used in all aspects of life, from drinking water to industrial processes. Water is also a primary source of energy, as it is used to generate electricity. Water is essential for agriculture, as it is used to irrigate crops. Water is also essential for transportation, as it is used to transport goods and services. Water is essential for recreation, as it is used for swimming, fishing, and boating. Water is essential for health, as it is used for drinking and for the proper functioning of the human body. Water is essential for cleaning, as it is used to wash clothes, dishes, and other items. Water is essential for the environment, as it is used to support plant and animal life. Water is essential for energy, as it is used to generate electricity.
